a
Initiator noise has an optimum
free initiator
optimum, $m = 4$
$CV^2$ of free initiator
iterons per plasmid $m$
b
Its location crosses over with affinity
effective slope 0.46 ($R^2 = 0.88$)
optimal array size $m^*$
optimal array size $m^*$
dissociation constant $k_d$
c
Initiator amount is conserved, sites are not
free initiator $\bar{x}_f$
bound initiator $x_b$
capacity $\chi$
site number $m^*$
1.2×
2.5×
52.8×
15.0×
range across the parameter grid,
relative to geometric mean
d
At measured affinity, optima land in range
observed arrays, 3 to 7
$k_d = 1.9$ molecules
$k_d = 7.2$ molecules
$CV^2$ of free initiator
iterons per plasmid $m$
